

SALES DATA ANALYSIS

Imported the dataset into Power BI using Power Query Editor. Perform the necessary data cleaning steps to prepare it for analysis. Load the cleaned dataset into the Power BI model.

DATA CLEANING

- A. Removed duplicate rows
- B. Standardizing the `OrderDate` column to a consistent date format.
- C. Handle missing values in the order date column by filling manually using “Replace”.
- D. Missing values in customer name, region, product filled with “UNKNOWN”.
- E. Unit price column missing value filled by calculating sales by quantity.
- F. Missing values in the sales column are handled by creating a custom column and hiding the sales column.
- G. Missing values in the profit and cost columns are replaced by using DAX of average and fill using “Replace”.
- H. Fix format type of each column.
- I. Created calculated column name profit/cost difference.

DATA VISUALIZATION

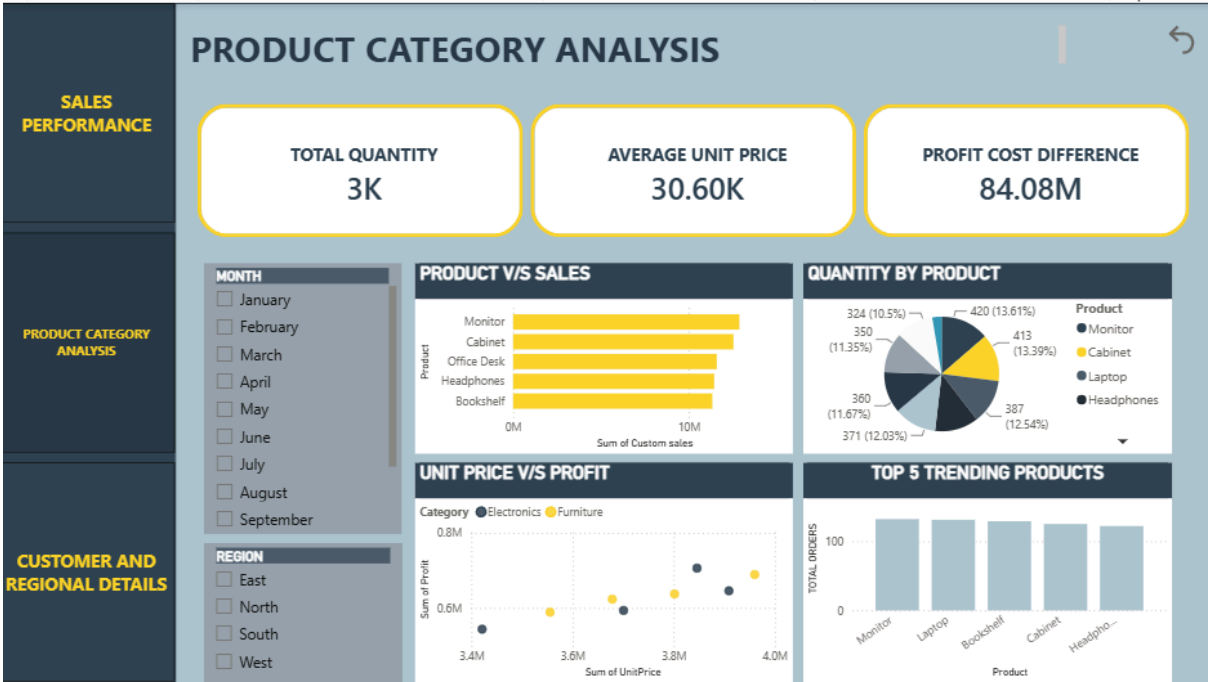

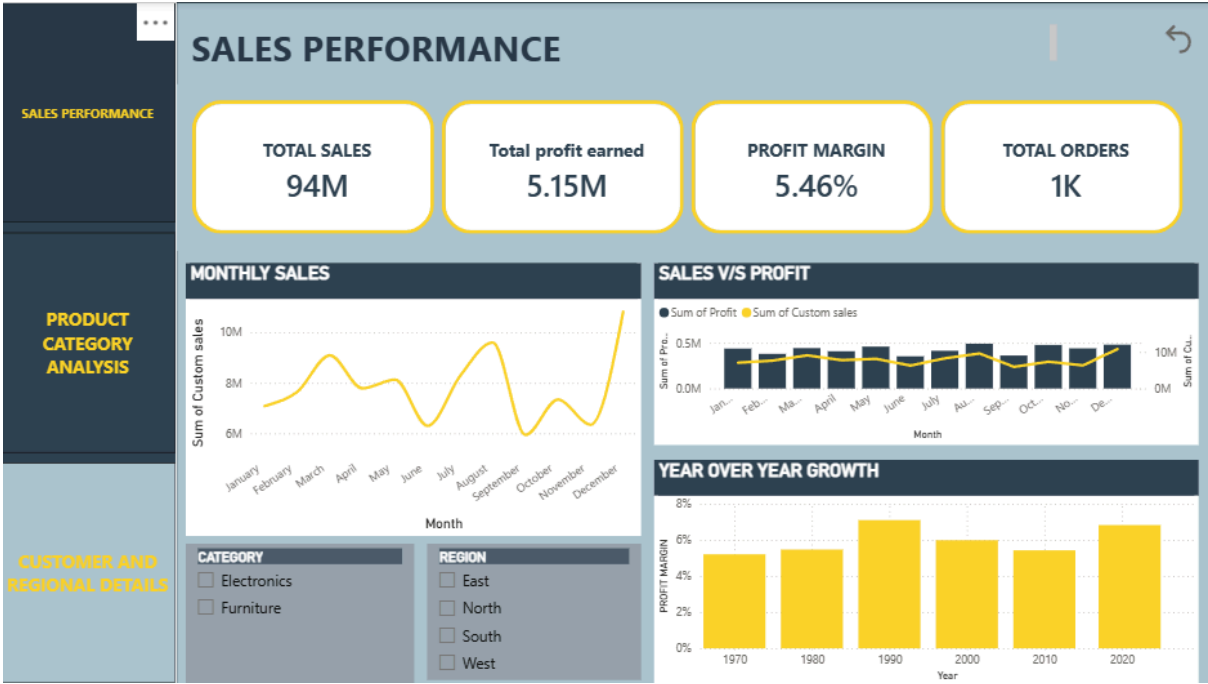

- a) Created a **Pie Chart** showing order distribution across different regions.
- b) Created a **Column Chart** to display the **top 5 trending products** based on the number of times each product was ordered.
- c) Created a **Line Chart** to show the **profit trend over time**.

Then created 3 page dashboard analysis

1. Sales performance
2. Product category analysis
3. Customer and regional details

It includes KPIS, SLICERS, GRAPHS, BOOKMARK, RESET, NAVIGATOR etc as shown in picture

Included insight and recommendation page also

MONTH

PRODUCT V/S SALES

QUANTITY BY PRODUCT

UNIT PRICE V/S PROFIT

TOP 5 TRENDING PRODUCTS
